June Makhubela's issue identification document.

Page 1 (index.html)

1. Regularly fixed indentation by using ctrl + alt + F.
2. Added a meta tag, so that the website displays characters correctly.
3. Added "./" to the pathway of the href attribute to correctly reference the stylesheet.
4. Added lang = "en" on the html opening tag so that the website reads in English.
5. Added a navigation bar on the header. The navigation bar was missing completely.
6. Properly aligned the title to center. Alignment was missing.
7. Added images folder to directory.
8. Renamed the welcome/profile photo to welcome.png.
9. Added the alternate attribute to the img tag. This was missing completely, and it posed an accessibility issue.
10. Added an email link to the footer. It was just plain unclickable text at first.
11. Changed the welcoming text on the hero section.
12. Changed the text on the about me section, it was lorem ipsum at first. Then added links to the contact and projects page.
13. Changed generic tags with semantic HTML5 elements across the html pages to header, main, section, article and footer tags.

Page 2 (about.html)

1. Regularly fixed indentation by using ctrl + alt + F.
2. Similarly added a meta tag.
3. Similarly added "./" to the href attribute. It was missing.
4. Similarly added lang = "en". It was missing.
5. Similarly added a navigation bar. It was completely missing.
6. Edited the paragraph on developer background section to be more informative.
7. Used h2 heading for the photo section and h3 for background and skills for better visual appearance.
8. Added a table to list developer skills. It was completely missing.
9. Removed my photo section to be right below the header for better flow/hierarchy. And I renamed the section to "Meet JuneDevs".
10. Fixed footer to resemble the one in the home page

Page 3 (projects.html)

1. Similarly fixed indentation, added a meta tag, added "./" to the href attribute, and added a navigation bar.
2. Added a main tag to add a list of projects.
3. Added images for projects 1 and 2, and added their respective alternate attributes. Sections for the images were present but the photos and the alt text were missing.
4. Added project 3. It was not there completely. I added the title, photo and alt text.
5. Fixed footer to resemble the one in the home page.

Page 4 (contact.html)

1. Similarly fixed indentation, added a meta tag, added "./" to the href attribute, and added a navigation bar.
2. Added more input types to the form. I added the tel input type for the user's phone number and a dropdown list for the user's contact preference.
3. Added corresponding labels to the input types. Labels were completely missing.
4. Added validation to the inputs.
5. Added form ID, action and method attributes. These were completely missing.
6. Fixed footer to resemble the one on the home page.

Stylesheet (styles.css)

1. Added navigation styling. It was completely missing.
2. Managed to use hover and focus pseudo-classes in the navigation bar.
3. Used selector combinations in the navigation bar..
4. Removed 36px font size for h2 heading, as it made the h2 heading appear like an h1 heading.
5. Changed the background color of the body tag to #ddd. This was just my style choice.
6. Changed the background color of the hero section to match the body, to fix the poor color contrast that initially existed.
7. Changed the hero and footer padding to 30px, to left-align the main content of the home page.
8. Fixed the width and height of the img tags to 325px respectively. I used the element tag so that any image added would have the same dimensions. This improves uniformity and visual appearance.
9. Combined selectors to left-align the rest of the html pages'content.
10. Added styling for the table on the about me page. It was completely missing.
11. Added styling for the forms. It was completely missing.
12. Added styling for the submission button. Styling was completely missing.
13. Added basic CSS animation for the footers on all of the website's pages. (for bonus appeal)
14. Added comments for better readability.
15. Fixed indentation by using ctrl + alt + F.
